TOLCARNE BEACH - CLIFF SLOPE STABILISATION
NEWQUAY, CORNWALL

ROCKFALL SECURED DRAPERY SYSTEM
Product: Steelgrid HR 100 PVC Kit + Polymeric DT Rockfall Netting

Problem
An access road leads to Tolcarne beach down a narrow cliff road from the top of the cliff. The shape of the road is similar to a hairpin. The road flows to a car park halfway down the cliff and then ultimately to the beach itself.

In November 2016, debris fell from the cliffs and slid down onto the beach access road. This landslide resulted in the access road being closed for public safety. After site visits and slip analysis, it was decided that the road could not be reopened without work to secure the cliff.

Solution
Designed by John Grimes Partnership, the works involved drilling soil nails and anchors into the bedrock, some up to six metres in length. These will then have plates screwed onto the end which, when tightened, will hold larger parts of the failing cliff in place. Smaller pieces will be caught by the standard Maccaferri polymeric rockfall netting, which will also be attached to the anchors. These can be released under control by loosening the mesh, allowing them to fall safely.

Abcas (UK) Ltd was involved in this project at Newquay, installing 3m wide rolls of Steelgrid® HR polymeric coated. Phase one of the work was completed in July 2017 and stabilised the two priority sections of the cliff. Phase two was completed before summer 2018. The beach reopened to the public on 27th July 2018.

Complex specialist design work, as well as significant ecological and environmental surveys, were undertaken to allow CORMAC CC to develop a permanent and versatile solution for the problem. The solution had to be able to be safely installed without impacting on the local fauna and flora, especially in the case of rare plants that could be damaged or nesting birds that could be disturbed.

To deter animals making their home in the cliff vegetation, a temporary covering of wire mesh was placed over the cliffs while design and preliminary investigation works took place. This meant that birds would not be able to make it their home for the nesting season.

Maccaferri rockfall solution was chosen as the best solution to provide reliable long-term performance for aggressive site conditions.

Client:
CORMAC

Main contractor:
ABCAS UK

Consultant:
JOHN GRIMES PARTNERSHIP

Products used:
STEELGRID HR 100 PVC (2,000sqm)

Date of construction
SUMMER 2017&2018 (two phases)
Steelgrid HR secured at the crest of the cliff

HR plate to fix the mesh to the designed anchors

View of the works in Autumn 2017
The solution was safely installed without impacting on the local fauna and flora.

View of the stabilised cliff. A coastal environment requires a polymeric coated steel mesh.

The solution was safely installed without impacting on the local fauna and flora.
